I suggest "logging host 'hostname|IPaddress'".

Even when it's a "server", it's still a "host" in internet parlance. It's
also shorter to type, and it meshes nicely with the typical CNAME for a
syslog host on a network, "loghost", i.e.,

        logging host loghost

would send syslog data to the site's default syslog server.

This is obvious to me, but it might not be so obvious to other users.

        Jim
